PROFESSIONAL SUMMARY

Software engineer with experience building AI-powered data-driven solutions across the full development lifecycle. Skilled in backend development (Java, Python, Apex), cloud technologies (AWS, Azure), and data engineering (SQL, Databricks). Proven ability to lead technical projects from requirements gathering through deployment, collaborating with cross-functional teams to deliver scalable solutions that drive measurable business impact.

EXPERIENCE

Thermo Fisher Scientific · Digital Leadership Development Program *July 2024 - Present*

IT Leadership Development rotational program with a focus on building technology leadership skills and a strong understanding of Thermo Fisher's instruments and related consumables.

Data Scientist (Third Rotation ~July 2025 - Present)

Data Scientist on the Intelligence Generation team, building and optimizing recommendation models that guide sales representatives toward high-impact product opportunities, measured by customer engagement and attributed revenue.

- Refined a model that identifies sales opportunities likely to close within 90 days based on recent instrument purchases. Implemented logic to advance to the next available recommendation when a previously suggested opportunity moves to closed status.
- Developed a model to identify the top five instruments due for replacement using lifecycle, age, and service frequency data. Designed input data workflows and implemented the scoring logic.

Software Engineer (Second Rotation ~January 2025 - July 2025)

Led the design and development of **AiVA**, an AI-powered Salesforce-integrated chatbot to streamline pre-call planning for sales representatives. This reduced the preparation time for customer meetings by providing product, account and opportunity information along with account specific insights.

- Drove requirements gathering and MVP feature prioritization by partnering closely with senior sales leaders.
- Leveraged Azure OpenAI APIs for natural language capabilities with an Apex backend and HTML/CSS/JavaScript frontend, piloting with 20 sales reps and expanded to 100 reps.

Data Product Analyst (First Rotation ~July 2024 - January 2025)

Worked on Thermo Fisher's Enterprise Data Platform (EDP), to consolidate data from nine business groups to power different data products and analytics.

- Designed SQL queries and Databricks workflows to ingest data into EDP. Translated data requirements into mapping documents for ETL processes.

Internships

- Amazon Web Services: Implemented a forecasting model to predict utilization of Amazon Aurora instances, to reduce host throttling and live migrations
- Lululemon Athletica: Worked on a project to encrypt PII data collected at the POS system being transported to back-end systems through their middleware (Kafka).

PROJECTS

Presented a demo of Model Context Protocol at the team's data science research symposium. The MCP server enabled exploration of Databricks Unity Catalog and summarized account data.

EDUCATION

University of Illinois at Urbana-Champaign *August 2020-May 2024*

Bachelor of Science in Computer Science & Advertising *GPA: 3.7*

TECHNICAL SKILLS

Database tools: SQL, Databricks, Salesforce, Pandas, DBeaver
Programming / Cloud: Java, Python, C, C++, AWS, Apex, Javascript, Pyspark
Other: Figma, Splunk, Salesforce, GitHub, Agile/Scrum
